EDUCATION

Howard University | Washington, DC **May 2028**
B.S. in Computer Science | GPA: 3.7/4

TECHNICAL SKILLS

Programming Languages: Python, C++, TypeScript
Frameworks & Libraries: Node.js, React.js,Bootstrap,Express, Next.Js
Databases: MongoDB, MySQL,PostgreSQL

EXPERIENCE

TechFellow | Codepath **June 2026 - August 2026**

- Supported 400+ students across three computer science courses by assisting with debugging, programming concepts, AI usage, and technical problem solving.
- Led breakout sessions and gave individualized support for students with agentic coding as well as software development fundamentals and programming assignments
- Collaborated with instructional staff to mentor students outside of the classroom as well as answering software development questions outside of class to improve student learning outcomes.

PROJECTS

rescened | MongoDB,Clerk,Express,React,Vercel,Railway **March 2026**

- Built a full-stack music discovery platform featuring album reviews, curated boards, user profiles, follows, notifications, and personalized activity feeds.
- Designed a community catalog submission and moderation workflow with server-side authorization, revision history, and transactional publication to prevent partial updates.
- Engineered a catalog ingestion pipeline integrating ListenBrainz, MusicBrainz, and Cover Art Archive, with schema validation, checksummed datasets, dry-run reports, and transactional imports that preserve curated metadata.

Fantasy Basketball Analytics Platform | Python, Pandas, MySQL, ESPN Fantasy API **May 2026**

- Designed a normalized MySQL schema and ETL pipeline that ingests league, roster, draft, matchup, and player-season data from the ESPN API with automated upsert logic.
- Built a confidence-weighted rest-of-season projection engine that blends prior-season pace, current-season pace, and ESPN projections, then scales it by each player's remaining games from a custom NBA-schedule module.
- Developed a value-over-replacement (VORP) model that derives position-specific replacement levels from league roster settings, producing one metric that ranks draft picks and waiver-wire targets on the same scale.
- Built a backtest harness for the projection engine; its miss analysis caught a silent zero-imputation bug that ranked a 36-ppg breakout player 502nd of 645, then fixed the root cause and re-validated.

mars2026 | Next.js,React,TypeScript,Tailwind CSS,Supabase,Stripe,Vercel, PostgreSQL **July 2026**

- Deployed a personal portfolio and poster-commerce site with Next.js, React, TypeScript, Tailwind CSS, Supabase, and Stripe, including gallery, commissions, shop, cart, authentication, account orders, and admin order views.
- Engineered a server-trusted multi-item checkout flow that validates catalog availability and Stripe price parity, persists pending orders, reuses customer records, and supports idempotent checkout recovery.
- Implemented a signature-verified Stripe webhook and Supabase order system with payment/fulfillment status transitions, shipping capture, order-item snapshots, RLS policies, and automated checkout-security tests.
